Title	Victorian Benthic Habitats - Open Coasts
Date	2017-05-03
Date type	Creation
Abstract	<p>The Victorian seabed habitat map documents the distribution of broad benthic habitat types in Victorian Coastal Waters to the State's 3 nautical mile jurisdictional limit. The map was created using a top-down modelling process whereby habitat descriptors were assigned using seafloor structure and biological information derived from multibeam sonar (Victorian Marine Habitat Mapping Project), bathymetric LiDAR (Future Coasts program) and observations from underwater video.</p> <p>Identification of benthic biota, to the lowest discernible taxonomic level, and substrate characteristics were recorded according to the Victorian Towed Video Classification scheme (Ierodiaconou et al. 2007).</p>

Lineage

Statement	Habitat maps in raster format were converted to vector type files (polygons) with a minimum areal mapping unit of 20 by 20 metres (400m ²) corresponding to a map scale of approximately 1:50,000. Habitat descriptors are based on the best available information for each area and therefore biological resolution varies along the coast.
